

WHAT IS NEW WORLD SCREW WORM?

New World screwworm larvae feed on living tissue of warm-blooded animals. They infest open wounds (or natural orifices), causing deep, painful lesions, infections, and potentially death if untreated. *Though not yet present in New Mexico, vigilance is critical to preventing establishment.*

WHAT TO WATCH FOR

- Open wounds that worsen or do not heal
- Animals exhibiting restlessness, licking or biting at a wound, or isolating themselves
- Visible maggots in wounds
- Swelling, discharge, foul smell, or unusual tissue deterioration

WHAT YOU CAN DO IN NEW MEXICO

Animal Management & Biosecurity

- Inspect animals regularly
- Maintain strict wound care: clean, disinfect, cover when feasible, isolate animals with open wounds
- Consult your veterinarian prior to moving animals

Veterinarian Engagement

- Talk with your veterinarian about diagnosis and treatment options, including insecticides and larvicides approved for use in New Mexico
- Ask your vet about preventative strategies appropriate to your operation

Why New Mexico Is Taking This Seriously

- The state's livestock sector, rural communities, wildlife populations, and pets are vulnerable
- Early detection and rapid response are essential to prevent spread and protect agriculture

Fly Traps & Surveillance

- State and federal teams place and monitor fly traps in potentially vulnerable counties
- Do not disturb traps if you see them — they are critical for tracking NWS
- If you notice a damaged or tampered trap, please report it to NMDA or the New Mexico Livestock Board immediately

REPORTING SUSPECTED CASES

- If you see any signs consistent with screwworm, report immediately.
- In New Mexico, call the New Mexico Livestock Board (505-841-6161) After hours, call the AgroGuard Hotline (1-800-525-2782) or fill out NMDA's reporting form. (scan QR code)
- Testing kits are available at your local NMSU Cooperative Extension Office (scan QR code)
